Memo:

In the end I chose Truncated SVD because the customer-product matrix is sparse and SVD can factor it without centering unlike PCA. At 200 components the product data shrinks from 119.46 MB to 4.22 MB, the job runs in 0.5 seconds, and the correct product appears in the top 10 suggestions for 22.92% of customers, against the 14.65% for best sellers. Results cover 1,898 eligible test customers.
